

Warframe Jarvis — Master Session Log

Living document. Append only — never rewrite history. At the start of each session: paste this document. At the end: update it. Maintained by Claude (project manager) and ChatGPT (active dev partner).

Project Overview

Warframe Jarvis is a cinematic personal Warframe build intelligence platform combining:

- React + Vite frontend
- Supabase Postgres backend
- Python ETL pipelines
- Custom cultivation/codex identity system
- Archon shard progression tracking (NOW vs GOAL)
- Full loadout management
- Cinematic frame detail pages
- Weapon database (634 weapons seeded)
- Long-term analytics and AI advisor goals

The platform functions as a **tactical doctrine OS** — not a build tracker, not a CRUD app. Core identity pillars: immersion, identity, tactical readability, cinematic presentation, progression tracking, doctrine intelligence.

Current Architecture Snapshot

Frontend

- React + Vite + Tailwind
- Dynamic cultivation theming throughout
- Component architecture:
 - `FrameCard.jsx` — catalog card with school identity rendering
 - `ShardChip.jsx` — shard chip (current + goal sizes)
 - `ShardEditModal.jsx` — Edit Archon Shards (Now/Goal sub-tabs)
 - `BuildDetailOverlay.jsx` — cinematic frame detail page (primary editing entry point)
 - `useFrames.js` — central data hook

- `shards.js` — shard color/shape constants
- `SCHOOL_ICONS` — centralized school → symbol → color mapping

Navigation Architecture (IMPORTANT)

Home (catalog) → Cinematic Detail Page → Edit Arsenal / Edit Archon Shards

Editing no longer happens from homepage cards. All editing is contextual inside the cinematic detail page. This affects every future feature's UX architecture.

Backend

- Supabase Postgres (us-west-1)
- Schemas: `wf_base` (game data), `wf_user` (personal builds)

Active Tables

Table	Purpose
<code>wf_base.warframes</code>	Canonical frame list
<code>wf_base.archon_shard_effects</code>	Shard effect reference
<code>wf_base.weapons</code>	634 weapons (primary, secondary, melee)
<code>wf_user.my_frames</code>	Personal builds + cultivation identity
<code>wf_user.archon_shard_slots</code>	Current shard loadout
<code>wf_user.archon_shard_slots_target</code>	Goal shard loadout
<code>wf_user.build_status</code>	Build readiness flags
<code>wf_user.kpm_sessions</code>	Kill performance data

DB Columns on `wf_user.my_frames`

- `cultivation_color` — hex color per frame
- `cultivation_school` — school name
- `cultivation_art` — wuxia dao name

ETL Scripts

Script	Purpose
ETL/migrate_to_supabase.py	Initial Excel → Supabase migration
ETL/seed_cultivation_colors.py	Seeds cultivation_color for all frames
ETL/seed_weapons.py	Seeds 634 weapons into wf_base.weapons

Stack

- Database: Supabase (Postgres)
 - Frontend: React + Vite + Tailwind
 - ETL: Python (.venv at C:\Users\jideo\Warframe_Project\.venv)
 - Editor: VS Code
 - Version control: GitHub (PatrickOnuohaJr)
 - Active dev partner: ChatGPT (implementation) + Claude (project management)
-

Feature Status Tracker

Feature	Status
Basic frame cards	COMPLETE
Current shard editing	COMPLETE
Goal shard editing	COMPLETE
Goal persistence	COMPLETE
Copy Goal → Current	COMPLETE
Copy Goal → Another Frame	COMPLETE
School-based visual system	COMPLETE
School symbol system (SCHOOL_ICONS)	COMPLETE
Cinematic detail overlay	COMPLETE
Edit Arsenal (inside detail page)	COMPLETE

Feature	Status
Edit Archon Shards (inside detail page)	COMPLETE
Immediate tier updates	COMPLETE
Cultivation doctrine rendering	COMPLETE
School filter bar	COMPLETE
Cultivation color ETL (54/57)	COMPLETE
Weapon DB (634 weapons)	COMPLETE
Weapon autocomplete UI	IN PROGRESS
Weapon search dropdowns (DB-backed)	IN PROGRESS
School page navigation	PLANNED
Themed school pages	PLANNED
Animated elemental school effects	PLANNED
Enhanced autocomplete — Phase 5	PLANNED
Intelligent weapon ranking — Phase 6	PLANNED
Doctrine intelligence layer — Phase 7	PLANNED
True predictive search engine — Phase 8	PLANNED
KPM dashboard	PLANNED
Recommendation engine	PLANNED
Analytics layer	PLANNED
AI build advisor (Jarvis)	PLANNED
Mobile optimization	NOT STARTED

Full Roadmap

Phase 1 — Database + ETL

Supabase schema, Python ETL, 57 frames migrated from Excel.

Phase 2 — Catalog UI

Card grid, shard chips, NOW/GOAL rows, tier badges, school identity, cinematic detail page.

Phase 3 — KPM Dashboard

Session log table, vs Hayden Tenno baseline, per-frame run history, manual session entry.

Phase 4 — Weapon DB Integration (partial)

634 weapons seeded. Autocomplete UI in progress.

Phase 5 — Enhanced Weapon Autocomplete

Arrow key navigation, enter-to-select, tab completion, best-match prioritization, favorite/recent weighting, category grouping, Incarnon prioritization.

Phase 6 — Intelligent Weapon Ranking

Context-aware recommendation ordering. Frame synergy, doctrine/school, Incarnon ownership, shard setup, arcane synergy.

Example: Mesa typing "re" prioritizes Redeemer Prime, Regulators, Rauta — not alphabetical.

Phase 7 — Doctrine Intelligence Layer

Weak build link detection, replacement recommendations, build optimization engine, combat role identification, school synergy validation, arcane recommendation engine, doctrine consistency checks.

Example outputs:

- "This build lacks viral primer support."
- "Battery/Molt doctrine would scale better with Burston Incarnon."
- "Current shard distribution underutilizes shield gate scaling."

Phase 8 — True Predictive Search Engine

Fuzzy matching, typo correction, alias recognition, search scoring, intent-aware retrieval.

Libraries considered: Fuse.js, MiniSearch, FlexSearch.

Example: typing "prae" still finds Praedos.

Long-Term

School navigation pages, animated elemental school environments, doctrine lore expansion, mastery progression, school ranking systems, combat history, frame lineage.

Cultivation School Reference

14 schools. Each frame has `cultivation_color`, `cultivation_school`, `cultivation_art`.

School	Key Frames	Color Range
Crimson Sanguinary School	Garuda Prime, Valkyr Prime, Kullervo	Deep reds
Adolla Pyric School	Ember Prime, Wisp Prime, Jade	Oranges/golds
Hallowed Path of Heaven's Light	Oberon Prime, Trinity Prime, Harrow Prime, Baruuk Prime	Greens/whites/blues
Heavenly Mandate Pantheon	Nezha Prime, Wukong Prime, Excalibur Umbra	Vermilion/gold/black
Storm Heaven Convocation	Volt Prime, Gyre, Gauss Prime, Zephyr Prime, Styanax, Hildryn Prime, Mag Prime	Blues/golds
Moonless Veil Order	Ash Prime, Loki Prime, Ivara Prime, Mirage Prime, Voruna, Banshee Prime	Darks/jades
Necropolis Dominion	Nekros Prime, Sevagoth, Dagath	Purples/darks
Plague Garden Sect	Saryn Prime, Nidus Prime, Oraxia, Nokko, Qorvex	Greens/maroons
Tidal Abyss Confraternity	Hydroid Prime, Frost Prime, Gara Prime, Citrine, Khora Prime	Blues/whites/silvers
Cosmic Antimatter Council	Nova Prime, Caliban, Xaku Prime, Nyx Prime	Magentas/purples
Desert Crown Reliquary	Inaros Prime	Deshret Gold
Ironclad Mountain Hall	Rhino Prime, Atlas Prime, Grendel, Chroma Prime	Bronzes/crimsons
Phantom Theater Atelier	Octavia Prime, Dante	Lavender/indigo
Chronos Engineering Bureau	Protea Prime, Vauban Prime, Mesa Prime, Cyte-09, Koumei, Uriel	Teals/cobalts/crimsons

Key Design Decisions (permanent record)

Decision	Reasoning	Session
Supabase over SQL Server	Cloud-hosted, Postgres, auto API, edge functions for AI	000

Decision	Reasoning	Session
	later	
React + Vite + Tailwind	Same stack as Scent Cloud, familiar pattern	000
Wide shard slots (1 row/frame)	Matches how builds are thought about; easier manual entry	000
Two shard tables (current + target)	Clean separation of NOW vs GOAL states	001
Cultivation color system	Wuxia-inspired identity — each frame has a dao and color	002
Volt color:  #5A6472	Original  #161D23 too dark on black UI	002
Nidus color:  #4A0E0E	Deep contained crimson — mastery over infestation, not chaos	002
Cinematic UI over dashboard	Platform identity: codex OS not spreadsheet	002
SCHOOL_ICONS centralized	Schools/symbols/colors/doctrine all synchronized from one map	003
Home → Detail → Edit flow	Editing is contextual inside cinematic page, not from homepage	003
Edit Arsenal + Edit Shards separated	Maintains immersion, contextual editing inside detail page	003
Replace JSX sections wholesale	Partial patching causes parse failures; full section replacement is safer	003
Cultivation colors must be visible on dark theme	Identity preservation + readability both required	003

Open Issues / Parked Items

Item	Notes	Session Raised
Qorvex — no build data	No weapons, title, or shards. Entry point: loadout editor in detail page	002

Item	Notes	Session Raised
3 frames missing cultivation_color	Qorvex + 2 name mismatches in seed script	002
cultivation_school + cultivation_art columns	Verify these exist and are populated in Supabase	002
Weapon autocomplete UI	DB seeded, UI not yet built	003
School navigation pages	Architecture not yet decided	planned
Animated elemental school effects	Flames, void particles, sand, lightning per school	parked
Doctrine lore expansion	Mastery progression, school rankings, combat history	parked

Important Design Philosophy

Warframe Jarvis is not a CRUD app. It is a **tactical doctrine OS**.

Core pillars: Immersion · Identity · Tactical readability · Cinematic presentation · Progression tracking · Doctrine intelligence

Session Log

Session 000 — Initial Foundation

Date: 2026-05-10

Accomplished:

- Established full project vision and stack
- Migrated from SSMS/FastAPI to Supabase
- Deployed 7-table Postgres schema
- ETL migrated 57 frames + 10 KPM sessions from Excel
- Built React + Vite frontend, card grid, shard editing, useFrames hook

Bugs Fixed:

- Supabase permission denied → GRANT statements

- on_conflict missing unique constraint → ALTER TABLE
 - Python venv not activated at root
 - Supabase anon key truncated in .env
-

Session 001 — Goal Tracking & Workflow Systems

Date: 2026-05-10

Accomplished:

- Refactored monolithic App.jsx into component architecture
- Built NOW vs GOAL shard system with separate Supabase persistence
- Added Copy Goal → Current and Copy Goal → Another Frame
- Added school-sorted frame copy modal
- Added clear slot / clear all current shards

Bugs Fixed:

- JSX bracket mismatches
 - Goal rows mirroring current rows
 - Incorrect state propagation
-

Session 002 — Cultivation Color System + Cinematic UI

Date: 2026-05-11

Accomplished:

- Generated full cultivation codex: 57 frames × 14 schools
- Added cultivation_color, cultivation_school, cultivation_art to DB
- ETL seed script — 54/57 frames seeded
- Wired cultivation colors into card title styling (S/A/B tier rules)
- Built school filter bar and cinematic BuildDetailOverlay
- Built full loadout editor (Loadout tab + Shards tab)
- Platform transitioned: build tracker → cinematic cultivation codex OS

Color Decisions:

- Volt:  →  | Nidus:  | Loki:  | Nekros: 

Session length: ~7-9 hours

Session 003 — Weapon DB + Cinematic Architecture + Doctrine Systems

Date: 2026-05-12

Accomplished:

1. Cultivation identity system fully implemented — banners, symbols, thematic coloration on every card
2. SCHOOL_ICONS centralized mapping system created and fixed symbol inconsistencies
3. Cinematic Build Detail Page built — hero banner, doctrine display, arsenal, shards, doctrine description
4. Navigation architecture shifted: Home → Detail Page → Edit (no more editing from homepage)
5. Edit Arsenal and Edit Archon Shards separated inside detail page
6. Immediate tier updates wired — reflects instantly on card and detail page
7. Weapon DB seeded — `wf_base.weapons` created, `ETL/seed_weapons.py` built, 634 weapons seeded
8. Roadmap expanded with Phases 5-8 (autocomplete → intelligent ranking → doctrine intelligence → predictive search)

Bugs Fixed:

- JSX parse errors → wholesale section replacement confirmed as standard approach
- Cultivation tooltip clipping → redesigned doctrine box layout
- Volt `#161D23` invisible → adjusted to `#5A6472`
- Detail page transparency bug → reworked z-index and layering
- Supabase permission denied on weapons table → granted SELECT/INSERT/UPDATE to service role
- `npm ENOENT` → must run `npm run dev` from inside `warframe-client/`

Session length: ~7-9+ hours

State at end of session:

- Platform contains: identity systems, doctrine systems, weapon infrastructure, cinematic navigation, progression systems, scalable metadata architecture
- Weapon autocomplete UI is the immediate next task

Next Priority Queue:

1. Weapon autocomplete UI (DB-backed dropdowns in Edit Arsenal)
2. Fuzzy search evaluation (Fuse.js / MiniSearch / FlexSearch)
3. School navigation pages
4. Thematic school environments + animated effects
5. KPM dashboard
6. Doctrine intelligence / recommendation engine
7. Analytics layer
8. AI build advisor (Jarvis layer)
9. Mobile optimization
