

Warframe Jarvis — Session Recap & Engineering Log

Session Focus: Cultivation Doctrine System — Full 57-Frame Seed, Database Normalization, Build Title Repair, Frontend Doctrine Rendering

1. Session Goal

Complete the cultivation identity system for all 57 frames in the Fifty-Seven Daos of the Tenno Codex. This included:

- Renaming three frames (Revenant, Ash, Qorvex) with proper Codex titles
 - Diagnosing and fixing a cascading build_title targeting failure
 - Seeding full cultivation doctrine paragraphs for all 57 frames
 - Wiring the frontend to read `cultivation_doctrine` instead of the static fallback
-

2. Frames Renamed This Session

Frame	Old Title	New Title
Revenant Prime	Ghost Freak	The Consumed King
Ash Prime	Shadow Monarch (kept)	The Ashen Patriarch (identity)
Qorvex	Chernobyl Toxic	Reactor Apostle

Note: Ash's `build_title` remained `Shadow Monarch` (the Codex title) but his `cultivation_identity` was updated to `The Ashen Patriarch` — the distinction between build title and identity was clarified this session.

3. Root Cause Analysis — Why Updates Weren't Landing

Problem

Multiple cultivation UPDATE statements ran with `Success. No rows returned` but data remained NULL in the DB.

Root Causes (in order of discovery)

1. Wrong WHERE clause targets

- Early scripts used `where build_title = 'Revenant Prime'` but `build_title` stores the Codex title (`'Ghost Freak'`), not the frame name.
- Postgres silently succeeds on 0-row UPDATES — no error, no warning.

2. `wf_base.warframes` had wrong frame names

- `warframe_id 26` stored as `'Ghost Freak'` instead of `'Revenant Prime'`
- `warframe_id 54` stored as `'Qourvex'` (typo) instead of `'Qorvex'`
- `warframe_id` for Grendel stored as `'E Honda'`
- Fixed directly in `wf_base.warframes`

3. Python ETL NaN artifact

- Frames seeded without a `build_title` got the string `'nan'` stored instead of `NULL`
- Caused by pandas not calling `.fillna()` before insert
- Fixed with: `update wf_user.my_frames set build_title = null where build_title = 'nan'`

4. Em-dashes breaking Supabase SQL parser

- Doctrine strings containing `⎵` (U+2014) caused Supabase's SQL editor to misparse the query, treating the WHERE clause as part of the string
- Supabase falsely flagged queries as "UPDATE without WHERE clause"
- Fix: replaced all em-dashes with `⎵` (hyphen) in SQL strings
- Final fix: switched to Postgres dollar-quoting (`$doc$...$doc$`) which eliminates all apostrophe and dash parsing issues entirely

5. Frontend reading wrong column

- Doctrine box was rendering `frame.cultivation_art` with a hardcoded fallback string
- `cultivation_doctrine` column existed and was populated but never read
- Fixed in `BuildDetailOverlay.jsx`

4. Build Title Normalization — Bulk Fix

Discovered that ~10 frames had `build_title = 'nan'` and 3 had `build_title = NULL` due to

ETL artifacts.

Fix Applied

```
sql

-- Step 1: Clear nan artifacts
update wf_user.my_frames
set build_title = null
where build_title = 'nan';

-- Step 2: Bulk assign Codex titles via JOIN on wf_base.warframes
update wf_user.my_frames mf
set build_title = case w.name
    when 'Garuda Prime'      then 'Blood Angel'
    when 'Revenant Prime'    then 'The Consumed King'
    when 'Qorvex'           then 'Reactor Apostle'
    -- ... (full mapping in bulk_build_titles_v2.sql)
    else mf.build_title
end
from wf_base.warframes w
where mf.warframe_id = w.warframe_id;
```

All 57 frames now have correct `build_title` values matching the Codex.

5. Base Table Corrections

Three entries in `wf_base.warframes` had incorrect names stored:

```
sql

update wf_base.warframes set name = 'Revenant Prime' where warframe_id = 26;
update wf_base.warframes set name = 'Qorvex'         where warframe_id = 54;
update wf_base.warframes set name = 'Grendel Prime'  where name = 'E Honda';
```

6. Frontend Fix — Cultivation Doctrine Rendering

File: `warframe-client/src/components/BuildDetailOverlay.jsx`

Added:

```
js
```

```
const doctrine = frame.cultivation_doctrine ?? null
```

Changed doctrine section from:

```
jsx

<p className="text-white/55 leading-relaxed">
  {art}. This build belongs to the {school}, using its loadout,
  shard path, and combat identity as a specialized doctrine within
  Warframe Jarvis.
</p>
```

To:

```
jsx

<p className="text-white/55 leading-relaxed">
  {doctrine
    ? doctrine
    : `${art}. This build belongs to the ${school}, using its loadout,
    shard path, and combat identity as a specialized doctrine within
    Warframe Jarvis.`
  }
</p>
```

Result: frames with `cultivation_doctrine` populated now render their full lore text. Frames without it fall back to the generated placeholder.

7. Full Doctrine Seed — All 57 Frames

Wrote and executed cultivation doctrine paragraphs for all 57 frames across all 14 Schools. Each doctrine follows consistent principles:

- **Ability reframing:** every ability described not by its mechanical effect but by its cultivation meaning ("X does not do Y. It Z.")
- **Lore grounding:** each doctrine rooted in the frame's canonical mythology, lore origin, and ability design intent
- **School consistency:** doctrine tone reflects School philosophy (Sanguinary bleeds, Hallowed tends, Necropolis harvests, etc.)
- **Length scaled to lore richness:** Wukong, Excalibur Umbra, Revenant, Harrow get longer entries; simpler frames are tighter

Files generated (all in `/mnt/user-data/outputs/`):

- `doctrines_part1.sql` — Crimson Sanguinary, Adolla Pyric, Hallowed Path
- `doctrines_part2.sql` — Heavenly Mandate, Storm Heaven Convocation
- `doctrines_part3.sql` — Moonless Veil, Necropolis Dominion
- `doctrines_part4.sql` — Plague Garden, Tidal Abyss, Cosmic Antimatter
- `doctrines_part5.sql` — Desert Crown, Ironclad Mountain, Phantom Theater, Chronos Engineering

All 57 ran successfully in Supabase using dollar-quoting and "Run query" on false WHERE warnings.

Also generated: `Warframe_Jarvis_Cultivation_Codex.pdf` — readable reference of all 57 doctrines with frame names in cultivation colors.

8. Key SQL Patterns Established This Session

Dollar-quoting for long doctrine strings (Postgres only):

```
sql

update wf_user.my_frames
set cultivation_doctrine = $doc$Your doctrine text here. Apostrophes like it's are f
where build_title = 'Frame Title';
```

Targeting by build_title vs frame name:

- `build_title` = Codex title (e.g. `'The Consumed King'`)
- Frame name lives in `wf_base.warframes.name`
- Always JOIN or target by `build_title` for user data updates

Supabase silent 0-row UPDATE detection:

```
sql

-- Always verify after running an update:
select build_title, cultivation_school, cultivation_identity
from wf_user.my_frames
where build_title = 'Target Title';
```

9. Known Issues / Next Session Priorities

Colors

- **Octavia Prime** — #E5B8E5 too dark on card, needs a lighter lavender
- **Ash Prime** — #3D3D3D renders as near-invisible on the dark card background

cultivation_identity still NULL for most frames

- "CULTIVATION IDENTITY PENDING" still showing on all cards
- `cultivation_identity` was only set for Revenant, Ash, Qorvex this session
- Needs a bulk UPDATE pass setting `cultivation_identity` for all 57 frames

Suggested next bulk UPDATE:

```
sql

update wf_user.my_frames
set cultivation_identity = build_title
where cultivation_identity is null;
```

This uses the `build_title` as the identity for all frames not yet assigned a distinct identity — quick fix to clear the pending banners.

Frontend migration (from previous session — still pending)

- Move frontend fully onto `accent_color`, `glow_color`, `background_style`
 - Deprecate `cultivation_color` / `cultivation_art` as display fields
 - Category-aware arcane filtering by slot type
 - Market pricing ETL retargeted to Supabase
-

10. Session Outcome

The cultivation doctrine system is now fully seeded and rendering. Every frame in the Jarvis Codex has:

- A correct `build_title` matching the Fifty-Seven Daos
- A `cultivation_school` assignment
- A `cultivation_doctrine` paragraph rendering in the frontend
- Correct `cultivation_color`, `accent_color`, `glow_color`, `background_style`

The project moved from cultivation metadata being placeholder-only to a fully lore-accurate, school-organized, ability-grounded identity system across all 57 frames.
